

(a) Reference-law decomposition

canonical-successor NLL (nats), lower is better

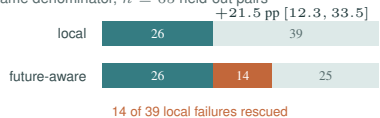

(b) A rescued decision

sealed pair 10, 5 verified edits, one override

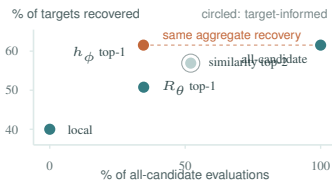

(c) Future reachability rescues failures

same denominator, $n = 65$ held-out pairs

(d) Prioritizing continuation evaluations

(e) Dynamic retargeting

paired post-switch utility, continue from x_τ vs. restart from x_0 , same remaining budget $n = 40$
